

# Simple Linear Regression Model

Given a response variable  $Y$  and an explanatory variable  $X$ , the formula for the model based on these two variables is:

# Simple Linear Regression Model

Given a response variable  $Y$  and an explanatory variable  $X$ , the formula for the model based on these two variables is:

$$Y_i = \beta_0 + \beta_1 X_i + \epsilon_i \quad (1)$$

# Simple Linear Regression Model

Given a response variable  $Y$  and an explanatory variable  $X$ , the formula for the model based on these two variables is:

$$Y_i = \beta_0 + \beta_1 X_i + \epsilon_i \quad (1)$$

and we assume that the  $\epsilon_i$  are independent random variables.
